

ABSTRACT OF THE DISCLOSURE

5 A micromirror unit is provided which includes a frame, a
mirror forming base upon which a mirror surface is formed, and
a torsion connector which includes a first end connected to
the mirror forming base and a second end connected to the
frame. The torsion connector defines a rotation axis about
10 which the mirror forming base is rotated relative to the
frame. The torsion connector has a width measured in a
direction which is parallel to the mirror surface and
perpendicular to the rotation axis. The width of the torsion
connector is relatively great at the first end. The width
15 becomes gradually smaller from the first end toward the second
end.
